Regular expressions and sed & awk

Regular expressions

- Key to powerful, efficient, and flexible text processing by allowing for variable information in the search patterns
- Defined as a string composed of letters, numbers, and special symbols, that defines one or more strings
- You have already used them in selecting files when you used asterisk (*) and question mark characters to select filenames
- Used by several Unix utilities such as ed, vi, emacs, grep, sed, and awk to search for and replace strings
 - Checking the author, subject, and date of each message in a given mail folder

```
egrep "^(From|Subject|Date): " <folder>
```

- The quotes above are not a part of the regular expression but are needed by the command shell
- The metacharacter | (or) is a convenient one to combine multiple expressions into a single expression to match any of the individual expressions contained therein
 - * The subexpressions are known as alternatives
- A regular expression is composed of characters, delimiters, simple strings, special characters, and other metacharacters defined below
- Characters
 - A character is any character on the keyboard except the newline character '\n'
 - Most characters represent themselves within a regular expression
 - All the characters that represent themselves are called *literals*
 - A special character is one that does not represent itself (such as a metacharacter) and needs to be quoted
 - * The metacharacters in the example above (with egrep) are ", ^, (, |, and)
 - We can treat the regular expressions as a language in which the literal characters are the *words* and the metacharacters are the *grammar*

Delimiters

- A delimiter is a character to mark the beginning and end of a regular expression
- Delimiter is always a special character for the regular expression being delimited
- The delimiter does not represent itself but marks the beginning and end of the regular expression
- Any character can be used as a delimiter as long as it (the same character) appears at both ends of the regular expression
- More often than not, people use forward slash '/' as the delimiter (guess why)
- If the second delimiter is to be immediately followed by a carriage return, it may be omitted
- Delimiters are not used with the grep family of utilities
- The metacharacters in the regular expressions are

- In addition, the following metacharacters have been added to the above for extended regular expressions (such as the one used by egrep)

- The dash (-) is considered to be a metacharacter only within the square brackets to indicate a range; otherwise, it is treated as a literal

- * Even in this case, the dash cannot be the first character and must be enclosed between the beginning and the end of range characters
- The regular expression search is not done on a word basis but utilities like egrep display the entire line in which the regular expression matches
- Simple strings
 - The most basic regular expression
 - Matches only itself
 - Examples

| Reg. Exp. | Matches | Examples |
|------------|----------|--------------|
| /ring/ | ring | ring |
| | | spring |
| | | ringing |
| | | stringing |
| /Thursday/ | Thursday | Thursday |
| | | Thursday's |
| /or not/ | or not | or not |
| | | poor nothing |

- Special characters
 - Cause a regular expression to match more than one string
 - Period
 - * Matches any character
 - * Examples

| Reg. Exp. | Matches | Examples |
|------------|----------------------------------|------------------|
| / .alk/ | All strings that contain a space | will talk |
| | followed by any character | may balk |
| | followed by alk | |
| /.ing/ | all strings with any character | singing |
| | preceding ing | ping |
| | | before inglenook |
| /09.17.98/ | Date with any separator | 09/17/98 |
| | | 09-17-98 |

- Square brackets
 - * Define a class of characters that matches any single character within the brackets
 - * If the first character immediately following the left square bracket is a caret '^', the square brackets define a character class that match any single character not within the brackets
 - * A hyphen can be used to indicate a range of characters
 - * Within a character class definition, the special characters (backslash, asterisk, and dollar signs) lose their special meaning
 - * A right square bracket appearing as a member of the character class can only appear as the first character following the square bracket
 - * A caret is special only if it is the first character following the square bracket
 - * A dot within square brackets will not be a metacharacter
 - · /07[.-]17[.-]98/ will not match 07/17/98 but will match 07-17-98
 - * Examples

| Reg. Exp. | Matches | Examples |
|----------------|-------------------------------|--------------|
| /[bB]ill/ | Member of the character class | bill |
| | b and B followed by ill | Bill |
| | | billed |
| /t[aeiou].k/ | t followed by a lowercase | talkative |
| | vowel, any character, and a k | stink |
| | | teak |
| | | tanker |
| /number [6-9]/ | number followed by a space | number 60 |
| | and a member of the character | number 8: |
| | class 6 through 9 | get number 9 |
| /[^a-zA-Z]/ | any character that is not a | 1 |
| | letter | 7 |
| | | @ |
| | | • |
| | | } |
| | | Stop! |

- Asterisk

- * Can follow a regular expression that represents a single character
- * Represents zero or more occurrences of a match of the regular expression
- * An asterisk following a period matches any string of characters
- * A character class definition followed by an asterisk matches any string of characters that are members of the
- * A regular expression that includes a special character always matches the longest possible string, starting as far toward the beginning (left) of the line as possible
- * Examples

| Dog Eyn | Matches | Evennles |
|--------------|-----------------------------------|-------------------------|
| Reg. Exp. | | Examples |
| /ab*c/ | a followed by zero or more b's | ac |
| | followed by a c | abc |
| | | abbc |
| | | debbcaabbbc |
| /ab.*c/ | ab followed by zero or more other | abc |
| | characters followed by a c | abxc |
| | | ab45c |
| | | xab 756.345 x cat |
| /t.*ing/ | t followed by zero or more | thing |
| | characters followed by ing | ting |
| | | I thought of going |
| /[a-zA-Z]*/ | a string composed only of letters | 1. any string without |
| | and spaces | numbers or punctuation! |
| /(.*)/ | as long a string as possible | Get (this) and (that); |
| | between (and) | |
| /([^)]*)/ | the shortest string possible that | (this) |
| | starts with (and ends with) | Get (this and that) |

- Caret and dollar sign

- * A regular expression beginning with a caret '^' can match a string only at the beginning of a line
 - \cdot The regular expression cat finds the string cat anywhere on the line but $\hat{}$ cat matches only if the string cat occurs at the beginning of the line
 - · ^ is used to anchor the match to the start of the line
- * A dollar sign '\$' at the end of a regular expression matches the end of a line
 - \cdot The regular expression cat finds the string cat anywhere on the line but cat\$ matches only if the string cat occurs at the end of the line, it cannot be followed by any character but newline (not even space)

* Examples

| Reg. Exp. | Matches | Examples |
|-----------|--------------------------------|----------------|
| /^T/ | a T at the beginning of a line | This line |
| | | That time |
| /^+[0-9]/ | a plus sign followed by | +5 + 45.72 |
| | a number at the beginning | +759 Keep this |
| | of a line | |
| /:\$/ | a colon that ends a line | below: |

- Quoting special characters
 - * Any special character, except a digit or a parenthesis, can be quoted by preceding it with a backslash
 - * Quoting a special character makes it represent itself
 - * Examples

| Reg. Exp. | Matches | Examples |
|-----------|------------------------------|-----------------|
| /end\./ | all strings that contain end | The end. |
| | followed by a period | send. |
| | | pretend.mail |
| /\\/ | a single backslash | \ |
| /*/ | an asterisk | *.C |
| | | an asterisk (*) |
| /\[5\]/ | [5] | it was five [5] |
| /and\/or/ | and/or | and/or |

- Range metacharacters

- * Used to match a number of expressions
- * Described by the following rules

 $r \in n$ Match exactly n occurrences of regular expression r Match at least n occurrences of regular expression r $r \in n, m$ Match between n and m occurrences of regular expression r

Both n and m above must be integers between 0 and 256

For now, r must be considered to be a single character regular expression (strings must be enclosed in bracketed regular expressions)

- Word metacharacters
 - * The word boundaries in the regular expressions are denoted by any whitespace character, period, end-of-line, or beginning of line
 - * Expressed by

\< beginning of word
\> end of word

• Rules

- Longest match possible
 - * A regular expression always matches the longest possible string, starting as far towards the beginning of the line as possible
- Empty regular expressions
 - * An empty regular expression always represents the last regular expression used
 - * Let us give the following command to vi

:s/mike/robert/

* If you want to make the same substitution again, the following is sufficient

:s//robert/

* You can also do the following

- Bracketing expressions
 - Regular expressions can be bracketed by quoted parentheses \ (and \)
 - Quoted parentheses are also known as tagged metacharacters
 - The string matching the bracketed regular expression can be subsequently used as quoted digits
 - The regular expression does not attempt to match quoted parentheses
 - A regular expression within the quoted parentheses matches exactly with what the regular expression without the quoted parentheses will match
 - The expressions /\ (rexp\) / and /rexp/ match the same patterns
 - Quoted digits
 - * Within the regular expression, a quoted digit (\n) takes on the value of the string that the regular expression beginning with the nth \n (matched
 - * Assume a list of people in the format

last-name, first-name initial

* It can be changed to the format

first-name initial last-name

by the following vi command

- Quoted parentheses can be nested
 - * There is no ambiguity in identifying the nested quoted parentheses as they are identified by the opening \ (
 - * Example

$$/\([a-z]\([A-Z]*\)x\)$$

matches

- Replacement string
 - vi and sed use regular expressions as search strings with the substitute command
 - Ampersands (ℰ) and quoted digits (∖n) can be used to match the replacement strings within the replacement string
 - An ampersand takes on the value of the string that the search string matched
 - Example

$$:s/[0-9][0-9]*/Number &/$$

- Redundancy
 - You can write the same regular expression in more than one way
 - To search for strings grey and gray in a document, you can write the expression as gr[ae]y, or grey|gray, or gr(a|e)y
 - * In the last case, parentheses are required as without those, the expression will match gra or ey which is not the intension
- Regular expressions cannot be used for the newline character

sed

• Stream editor

- Derivative of ed
 - Takes a sequence of editor commands
 - Goes over the data line by line and performs the commands on each line
- Basic syntax

- The commands are applied from the list in order to each line and the edited form is written to stdout
- Changing a pattern in the file

- sed does not alter the contents of the input file
- Quotes around the list of commands are necessary as the sed metacharacters should not be translated by the shell
- Selecting range of lines
- Command to remove the mail header from a saved mail message

• Removing the information from the output of the finger command to get only the user id and login time

• Problem: The first line should have been removed as well

• Indenting a file one tab stop

sed
$$'s/^{-}/^{-}$$
 file

- The above matches all the lines (including empty lines)
- Problem can be solved by

• Another way to do it

sed
$$'/^$/!s/^->/'$$
 file

• Multiple commands in the same invocation of sed

```
$ finger | sed 's/\([a-zA-Z][a-zA-Z]*\) .* \([0-9][0-9]:[0-9][0-9]\) .*/\1 \2/ > 1d'
```

The commands must be on separate lines

- sed scripts
 - The sed commands can be put into script files and can be executed by

• Lines containing a pattern can be deleted by

- Automatic printing
 - By default, sed prints each line on the stdout
 - This can be inhibited by using the -n option as follows

- Matching conditions can be inverted by the!

- The last achieves the same effect as grep -v
- Inserting newlines
 - Converting a document from single space to double space

```
$ sed 's/$/\
> /'
```

- Creating a list of words used in the document

```
$ sed 's/[ ->][ ->]*/\
> /q' file
```

- Counting the unique words used in the document

```
$ sed 's/[ ->,.][ ->,.]*/\
> /g' file | sort | uniq | wc -l
```

• Writing on multiple files

```
$ sed -n '/pat/w file1
> /pat/!w file2' filename
```

- Line numbering
 - Line numbers can be used to select a range of lines over which the commands will operate
 - Examples

```
$ sed -n '20,30p'
$ sed '1,10d'
$ sed '1,/^$/d'
$ sed -n '/^$/,/^end/p'
```

- sed does not support relative line numbers (difference with respect to ed)

awk

- Acronym for the last names of its designers Aho, Weinberger, Kernighan
- Not as good as sed for editing but includes arithmetic, variables, built-in functions, and a programming language like C; on the other hand, it is a more general processing model than a text editor
- Looks more like a programming language rather than a text editor

Table 1: Summary of sed commands

| a\ | append lines to output until one not ending in \ | |
|---------------|--|--|
| b label | branch to command: label | |
| c\ | change lines to following text (as in a \ | |
| d | delete lines | |
| i\ | insert following text before next output | |
| 1 | list line, making all non-printing characters visible | |
| | (tabs appear as >; lines broken with \) | |
| р | print line | |
| q | quit (for scripts) | |
| r file | read file, copy contents to stdout | |
| s/pat1/pat2/f | substitute pat 2 for pat 1 | |
| | f = g, replace all occurrences | |
| | f = p, print | |
| | f = w file, write to file | |
| t label | test: branch to label if substitution made to current line | |
| w file | write line(s) to file | |
| y/str1/str2/ | replace each character from strl with corresponding | |
| | character from str2 (no ranges allowed | |
| = | print current input line number | |
| !cmd | do sed cmd if line is not selected | |
| : label | set label for b and t commands | |
| { | treat commands up to the matching } as a group | |

- Mostly used for formatting reports, data entry, and data retrieval to generate reports
- awk is easier to use than sed but is slower
- Usage is

```
awk 'awk_script' files
```

• The awk_script looks like

```
pattern { action }
pattern { action }
...
```

- Input-driven language
 - awk reads one line in the file at a time, compares with each pattern, and performs the corresponding action if the pattern matches
 - There is no effect if the input file is empty
 - Run the following commands to see the effect:

```
touch foobar
awk '{print "Hello World"}' foobar
cat "Line 1" >> foobar
awk '{print "Hello World"}' foobar
cat "Line 1" >> foobar
awk '{print "Hello World"}' foobar
```

- As it reads each line, awk immediately breaks those up into segments (field) based on a specified field separator (FS)
- If you want to make awk work on empty fle, you can use the keyword BEGIN

```
awk 'BEGIN {print "Hello World"}'
```

- Just like sed, awk does not alter its input files
- The patterns in awk can be regular expressions, or C-like conditions
- grep can be written in awk as

```
awk '/regular expression/ { print }' filename
```

- Printing a message for each blank line in file

```
awk '/^$/ { print "Encountered a blank line" }' filename
```

- Either of pattern or action is optional and can be omitted
 - Omitting pattern performs the action on every line

```
awk '{ print }' filename
```

- Omitting action prints matched lines

```
awk '/regular expression/' filename
```

• Just like sed, the awk_script can be presented to awk from a file by using

- awk programming model
 - Main input loop
 - * Loop reads each line of input from file and makes it available for processing
 - * loop iterates as many times as the lines of input
 - * Loop terminates when there is no more input to be read
 - Two special keywords BEGIN and END specify the commands to be executed before the beginning of loop and at the end of loop, respectively
 - * The blocks specified by these two keywords are optional
- Fields
 - A field is a string of characters, separated by FS
 - By default, FS is any whitespace character
 - FS can be specified by a command line option
 - * Changing the field separator to colon (:)

```
awk -F: '/regular expression/ { action }' file
```

* To print the user names and real names in the passwd file

```
awk -F: '{print $1"\t"$5}' /etc/passwd
```

- The output of who has six fields as follows

```
sanjiv console Nov 18 13:26
sanjiv ttyp0 Nov 18 13:26 (:0.0)
sanjiv ttypc Nov 19 13:27 (:0.0)
vlad ttyp7 Nov 19 16:46 (arrak13.umsl.edu)
```

- The fields are called \$1, \$2, ..., \$NF
 - * NF is a variable whose value is set to the number of fields
 - * NF and \$NF are not the same
 - · NF is the number of fields
 - · \$NF is the contents (string) of the last field

• Printing

- The current input line (or record) is tracked by the built-in variable NR
- The entire input record is contained in the variable \$0
- To add line numbers to each line, you can use the following

- Fields separated by comma are printed separated by the field separator a blank space character by default
- Complete control of the output format can be achieved by using printf instead of print as follows

- printf in awk is almost identical to the corresponding C function

Patterns

- Checking for people who do not have a password entry in the file /etc/passwd

- Checking for people who have a locked password entry

awk -F:
$$'$$
\$2 == "*"' /etc/passwd

- Other ways to check for empty string

| \$2 == "" | 2nd field is empty |
|------------------|--|
| \$2 ~ /^\$/ | 2nd field matches empty string |
| \$2 !~ /./ | 2nd field does not match any character |
| length(\$2) == 0 | length of 2nd field is zero |

- The symbol ~ indicates a regular expression match while ! ~ indicates a regular expression non-match
- length is a built-in function to count the number of characters in the string (or field)
- Any pattern match can be preceded by ! to negate its match as follows

awk -F:
$$'!($2 == """)'$$
 filename

- Data validation using the number of fields as criterion - line valid if the number of fields is odd

- Printing excessively long lines (> 72 characters)

- Above problem with more informative solution

```
$ awk '(length($0) > 72) \
{ print "Line", NR, "too long: ", substr($0,1,50)}' filename
```

- The function substr(s, m, n) produces the substring of s beginning at position m and with a length of n characters; if n is omitted, it continues to the end of string
- Extracting information with substr

```
$ date
Wed Nov 20 14:27:33 CST 1996
$ date | awk '{ print substr ( $4, 1, 5 ) }'
14:27
```

- The BEGIN and END patterns
 - Special patterns used in awk scripts
 - BEGIN actions are performed before the first input line has been read (used to initialize variables, print headings, and like)
 - * Setting the field separator within the script

```
$ awk 'BEGIN {FS = ":"}
> $2 == "" ' /etc/passwd
```

- END actions are done after the last line has been processed
 - * Printing the number of lines in the input

```
awk 'END { printf NR }' ...
```

- Arithmetic and variables
 - awk allows you to do more sophisticated arithmetic compared to the shell
 - Adding the numbers in a column (first column), and printing the sum and average

```
\{ s = s + \$1 \}
END \{ print s, s/NR \}
```

- Variables can be created by users and are initialized to zero by default
- awk also allows for shorthand arithmetic operators like C

- Implementing wc in all its generality

- Variables can also store string of characters and the interpretation is based on context
- awk maintains a number of built-in variables of both types

Developing man pages with [nt]roff

"Acts oddly on nights with full moon."

- BUGS section for catman from 4.2BSD Unix manual

- nroff and troff
 - Native Unix programs to format text
 - Based on requests within the documents that start with a period in the first column
 - Commonly used requests are

- . I Italicize following line
- .B Following line in bold
- .R Following line in Roman
- .br Break the line
- .ce Center the following line
- .fi Fill lines (Align right margins)
- .ft Set font
- .na No right alignment
- .nf Do not fill lines (Preferable to .na)
- .sp One vertical line

• The manual page

- Stored in a subdirectory in the directory /usr/man
- The subdirectory is called manx where x is a digit or character to indicate the section of the manual
- The sections are numbered 1 to 8 and n and l
 - 1 User commands
 - 2 System calls
 - 3 C Library functions
 - 4 Devices and network interfaces
 - 5 File formats
 - 6 Games and demos
 - 7 Environments, tables, and troff macros
 - 8 Maintenance commands
 - 1 Misc. reference manual pages (Locally developed and installed)
 - n Misc. reference manual pages (New commands)
- Printed with the man (1) command
 - * A shellscript that runs nroff -man but may be compiled on newer machines
 - * The locally developed man pages can be tested for printing with nroff -man command
 - * The man pages in a given section can be printed by specifying the section number, for example, the man page for the system call umask can be printed by typing the command

man 2 umask

If the section number is not specified, the output will be for the user command from section 1

- The macros for man are discussed in section 7 of the manual and can be invoked by

man 7 man

• No manuals on the kernel

- Usual device driver man pages are user-level descriptions and not internal descriptions
- A regular joke was "Anyone needing documentation to the kernel functions probably shouldn't be using them."
- /* you are not expected to understand this $\star/$ -from Unix V6 kernel source
- Layout of a Unix manual page
 - The manual page is laid out as per the specifications in the man macro of troff
 - * Any text argument may be zero to six words
 - * Quotes can be used to include the space character in a "word"
 - * Some native nroff conventions are followed, for example, if text for a command is empty, the command is applied to the next line
 - A line starting with . I and with no other inputs italicizes the next line
 - * The prevailing indentation distance is remembered between successive paragraphs but not across sections
 - The basic layout of a man page is described by

```
.TH COMMAND <section-number>
.SH NAME
command \- brief description of function
.B command
options
.SH DESCRIPTION
Detailed explanation of programs and options.
Paragraphs are introduced by .PP
This is a new paragraph.
.SH FILES
Files used by the command, e.g., passwd(1) mentions /etc/passwd
.SH "SEE ALSO"
References to related documents, including other manual pages
.SH DIAGNOSTICS
Description of any unusual output (e.g., see cmp(1))
.SH BUGS
Surprising features (not always bugs)
```

- If any section is empty, its header is omitted
- The .TH line and the NAME, SYNOPSIS, and DESCRIPTION sections are mandatory
- The .TH line
 - * Begins a reference page
 - * The full macro is described by
 - .TH command section date_last_changed left_page_footer center_header
 - * Sets prevailing indent and tabs to 0.5"
- The .SH lines
 - * Section headers
 - * Identify sections of the manual page
 - * NAME and SYNOPSIS sections are special; other sections contain ordinary prose
 - * NAME section
 - · Names the command (in lower case)
 - · Provides a one-line description of it
 - * SYNOPSIS section
 - · Names the options, but does not describe them
 - · The input is free form
 - \cdot Font changes can be described with the <code>.B</code>, <code>.I</code>, and <code>.R</code> macros
 - · The name and options are bold while the rest of the information is in roman
 - * DESCRIPTION section
 - · Describes the commands and its options
 - · It tells the usage of the command
 - \cdot The man page for cc(1) describes how to invoke the compiler, optimizer, where the output is, but does not provide a reference page for the manual
 - \cdot The reference page can be cited in the SEE ALSO section
 - · However, man (7) is the description of the language of manual macros
 - · Command names and tags for options are printed in italics, using the macros . I (print first argument in italics) and . IR (print first argument in italic, second in roman)
 - * FILES section
 - · Mentions any files implicitly used by the commands

- * DIAGNOSTICS section
 - · Optional section and generally not present
 - · Reports any unusual output produced by the command
 - · May contain diagnostic messages, exit statuses, or surprising variations of the command's normal behavior
- * BUGS section
 - \cdot Could be called LIMITATIONS
 - · Reports shortcomings in the program that may need to be fixed in a future release
- Other requests and macros for man
- . IP $\, \mathbf{x} \,$ Indented paragraph with a tag $\mathbf{x} \,$
- .LP Left-aligned paragraph
- .PP Same as .LP
- .SS Section subheading
